Overview

Context

The goal of this analysis was to **evaluate past marketing campaigns** and identify opportunities to **improve conversion efficiency** and **optimize campaign budget** allocation more efficiently

Objectives

1. Uncover **inefficient campaign scaling** patterns
2. Analyze which **platforms, audience segments** and **geographic markets** were associated with stronger conversion performance.

North Star Metrics

We focused on two main metrics within this analysis

To evaluate **campaign spend efficiency**:

Cost Per Acquisition (CPA)

The average amount used to acquire a single purchase in a campaign.

To analyze the **acquisition quality** of segments:

Conversion Rate (CVR)

The percentage of people that purchased out of the total click traffic.

Insights and Findings

Higher campaign spend did not consistently translate into stronger acquisition outcomes.

- Several lower-budget campaigns achieved comparable purchase performance at significantly lower acquisition costs.
- This gap between campaign investment and conversion performance prompted a deeper analysis of the overall marketing data.

Facebook maintained higher conversion efficiency while operating at a scale that's 1.7x times higher than Instagram.

- This suggests that the platform, despite operating at a significantly larger volume, may still provide opportunities for efficient scaling.

Japan and Mexico demonstrated the highest conversion rate despite operating at a smaller share of total click volume.

- This may indicate the presence of high-intent audiences within these regions.

The 35-44 age cohort demonstrated the **strongest balance between click volume and conversion efficiency.**

- This segment may present opportunities for audience targeting optimization.
- In contrast, although the **55-65 age cohort** recorded similar conversion performance, **the significantly smaller traffic volume makes the result less reliable.**

Next Steps

The recommendations focuses on **reallocating budget from the low converting segments to the segments with stronger conversion efficiency.**

Recommendations:

Test further acquisition scaling on Facebook while closely monitoring the conversion rates and acquisition costs (CPA)

Recommendations:

Explore gradual expansion in Japan and Mexico, where conversion efficiency remained strong despite lower traffic volume.

Recommendations:

Increase targeting focus on the 35-44 age group, which demonstrated strong conversion efficiency on a meaningful acquisition scale.
